TITLE: Complexes of polyacrolein with heavy-metal salts

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 139, no. 6, 1961, 1372-1374

TEXT: It is noted that samples of polyacrolein powder obtained under different conditions differ in their ability to form coordination complexes with heavy-metal salts. The strongest ability to cause such reactions has uranyl nitrate. In the pH range investigated salts of Pb, Co, Mn, Cu, Ni, and Fe are not able to form stable complexes with polyacrolein. Concerning the extraction of heavy-metal salts with organic compounds, the authors refer to papers by V. M. Vdovenko (Khimiya urana i transuranovykh elementov (Chemistry of uranium and transuranic elements) Izd. AN SSSR, 1960) and V. I. Kuznetsov (Usp. khim., 23, v. 6, 654 (1954)). The maximum quantity of uranium ($2305 \cdot 10^{-6}$ g/g) was extracted from aqueous solutions by means of polyacrolein samples obtained by polymerization of acrolein in

TITLE: Use of Arsenazo I for extracting uranium from dilute solutions.

SOURCE: Zhurnal prikladnoy khimii, v.37, no.1, 1964, 231-232

TOPIC TAGS: Arsenazo I, uranium extraction, uranium recovery, activated carbon, silica gel, alumina, sorptive capacity, activated carbon with Arsenazo I, silica gel with Arsenazo I, alumina with Arsenazo I, uranium adsorption, adsorption isotherm

ABSTRACT: The sorptive capacity for uranium of adsorbents such as activated charcoal BAU, silica gel KSM, and alumina with Arsenazo I is increased 10-50% in comparison to the sorptive capacity of the pure carriers. The presence of Arsenazo I improves the extraction so that better adsorption is attained at a wider pH range. Impurities have varying effects on the sorption of uranium. Ammonium, sodium, and strontium nitrates increase extraction very slightly, with SrNO₃ decreasing it above pH 4. Aluminum and thorium lower extraction at

Card 1/2

ACCESSION NR: AP4010494

pH 2-3. The effect of ammonium chloride is significant and at pH 3.5-4.5, extraction of uranium in its presence is almost complete, but at higher and lower pH, extraction decreases due to complex formation with uranium. Orig. art. has: 3 figures.

PERIODICAL: Radiokhimiya, v.4, no.6, 1962, 660-667

TEXT: The complex forming ability of various polyacroleins was examined for the first time. This work forms a start of a long-term investigation of complex formation between metals and the derivatives of polyacrolein and other polymers with carbonyl groups. The polyacroleins investigated were obtained by 1) polymerization of acrolein in water in the presence of oxidation-reduction initiators; 2) polymerization of pure, dry acrolein without initiators; 3) low temperature (-20°C) polymerization in the presence of traces of H₂O or BF₃; 4) polymerization in benzene solution + Na; 5) block polymerization in the presence of lithium butyl at 20°C. The complexes with UO₂(NO₃)₂ were formed in aqueous solutions. The

II. Formation of complexes between poly(α -methyl)acrolein
and uranyl nitrate

PERIODICAL: Radiokhimiya, v.5, no.1, 1963, 103-106

TEXT: Polymerization of (α -methyl)acrolein was carried out with different catalysts to investigate the influence of substituents in the α position on the ability of the polymer to complex with $UO_2(NO_3)_2$. Ethyl-, propyl- and butyl-acroleins were also synthesized but could only be polymerized with metallic Na. Details of the polymerization procedures will be reported separately. Poly(α -methyl)acroleins obtained by emulsion polymerization with $AgNO_3$ and K_2SO_5 , Mohr's salt and K_2SO_5 , hyposulfite and K_2SO_5 absorbed 1000×10^{-6} g of U per g of polymer. Auto-polymerized polymer absorbed 2000×10^{-6} g of U per g of polymer, its content of aldehyde groups being of the same order (66 to 69 mol%) as in the previous polymers. The polymers

Card 1/2

Investigation of the processes ...

S/186/63/C05/001/C07/013
E075/E436

obtained in the presence of BF_3 , lithium-butyl and Na contained only 9 to 12% aldehyde groups and did not complex with U. The complex formation took place to the greatest extent at the pH values of 3 to 4. In general the presence of methyl groups in the polymer makes it hydrophobic and less capable of complexing with U than polyacrolein. There are 1 figure and 1 table.

TOPIC TAGS: polyacrolein inorganic salt reaction, polyacrolein reaction, polyvinylalcohol, coagulation, gel formation, metal precipitation, variable valence metal reduction, polyaldehyde, hydrated aldehyde group, thorium polyacrolein complex

ABSTRACT: In continuation of earlier work on polyacrolein and its ability to extract metals from aqueous solutions, a number of reactions were run or attempted between 3% polyacrolein and 3% mineral salt solutions. Aqueous solutions of polyacrolein have a series of characteristic properties explained by the presence of an external hydrate shell and hydrated aldehyde groups for the polymeric molecule:

Card 1/3

ACCESSION NR: AP4020057

acid medium. The complexes formed have constant compositions, differing depending on pH of the media: in acid solution one thorium atom is complexed with 24 or 28 elementary ligand links; at pH 4.73 and 8.32, with 8 and 9 linkages regardless of the ratio of the reactants. Reaction with potassium bichromate and ammoniacal solution of hydrated copper oxide gives, as do polyvinylalcohol solutions, gels which are insoluble in water. The structure of the polyacrolein-hydrated copper oxide complex may be represented by gelation of polyvinylalcohol. Preliminary data obtained indicates that elements with variable valence can be reduced with aqueous polyacrolein solutions under determined conditions. It is therefore assumed that the polyacrolein molecule can react as a polyaldehyde. This capacity of polyacrolein for many chemical and physical-chemical conversions makes it a theoretically and practically interesting material. Orig. art. has: 4 tables, 7 formulas, and 1 figure.

TITLE: A method for geophysical investigation of drill holes. Class 21, No. 182255
[announced by All-Union Sciontific Research Institute of Geophysical Exploration
(Vsesoyuznyy nauchno-issledovatel'skiy institut razvedochnoy geofiziki)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 11, 1966, 49

TOPIC TAGS: geologic exploration, geophysics, geochemistry

ABSTRACT: This Author Certificate presents a method for geophysical investigation of drill holes. The method is based on measuring the oxidizing-reducing potentials of rocks. To determine accurately the geological section of the drill hole, the walls of the hole are treated with a chemical reagent, such as hydrochloric acid, which intensifies the natural oxidizing-reducing potentials by changing the insoluble mineral forms of elements with variable valences into a soluble state. After a certain time, sufficient for dissolving the rocks, the artificially intensified oxidizing-reducing potentials are measured by the method of recording the potentials of the internal polarization.

.Tekhnika razbornykh lamp (Technology of Demountable Tubes) Moscow,
Svyaz'izdat, 1959. 111 p. Errata slip inserted. 8,400 copies printed.

Ed.: Ye. S. Novikova; Tech. Ed.: K.G. Markscha.

PURPOSE: This book is intended for engineering and technical personnel working
with high-power generator tubes.

COVERAGE: The authors present brief information on high-power demountable tubes
and their elements. They describe the construction and operation of auxiliary
vacuum equipment for these tubes and discuss tube servicing and maintenance.
The authors mention the following Soviet scientists and engineers who con-
tributed to the development of high-power demountable tubes up to 500 kw:
A.L. Mints, A.M. Kugushev, S.A. Zusmanovskiy, N.I. Oganov, P. N. Andreyev,
N.I. Karpovskiy, and M.I. Basalayev. They also mention the following radio
specialists of the Ministry of Communications who introduced demountable tubes

AUTHOR: Andreyev, P.N., Zatskaya, T.K., Neyman, M.S.

TITLE: A High-Power, Wideband Resnatron Amplifier

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiotekhnika,
1959, Vol 2, Nr 4, pp 391-398 (USSR)

ABSTRACT: A 10-kw resnatron amplifier is described briefly. It has a very wide frequency passband (about 6% of the mean frequency). The basic principles used for designing this amplifier are explained. The frequency passband had to be achieved without using some coupled oscillatory circuits, neither for the input, nor for the output. Not more than 6 kv feed voltage were to be used. The reaction of the output circuits on the input circuits and on the exciter were to be eliminated as far as possible. The electron-ray principle was used for designing the electrodes. The amplifier was built as an all-metal structure with continuous evacuation, thus all oscillatory systems and electrodes were placed in a common vacuum. The two oscillatory circuits

Card 1/3

06348
SOV/142-2-4-1/26

A High-Power, Wideband Resnatron Amplifier

of the amplifier are coaxial, halfwave systems. The input and output systems are tuned by pistons. Input and output of rf energy are designed for coaxial cables with 50 ohm impedance. A general diagram of the resnatron amplifier is shown in Figure 1. A photograph of this device is shown in Fig 2. A detailed diagram is shown in Fig 3. The most important components are shown in a photograph, Fig 4, and in diagrams, Figs 5 and 6. All basic units are watercooled. The constructional details are described briefly. During tests, the following data were established: Load capacity 11 kw; anode voltage and voltage at the screen grid 5.8 kv; bias voltage at the screen grid -165 volts; capacity in the exciting feeder 2.9 kw; current of the anode-screen unit 4.5 amps; control grid current 0.6 amps; cathode heater voltage 3.3 volts; henter current 1700 amps; cooling water consumption 20 liters per minute; continuous duty. The amplitude-frequency characteristic of the resnatron amplifier is shown in Fig 7.

TITLE:

High-efficiency Resonator Autogenerators of Meter and
Decimeter Waves

PERIODICAL:

Radiotekhnika, 1960, Vol. 15, No. 11, pp. 26-33

TEXT: The present paper deals with the design and testing of resonator autogenerators intended for the continuous generation of a high power output. The first generator is designed for a wavelength of 2.5 m and an output of 100 kw, the second for a wavelength of 1.5 m and an output of 60 kw, and the third for a wavelength of 40 cm and an output of 40 kw. All of these generators are of the resonator type, viz., all-metal tetrodes using a grounded-grid circuit. The principal units of the generators are made of copper and water-cooled. A great advantage of the design described is the absence of thermionic emission of the water-cooled grid lead-ins. The tuning elements are controlled by vacuum woggle joints. Fig. 2 shows the disassembled 40-cm generator which consists of a system of cathodes.

a control grid, a screening grid, an anode block, an anode vibrator, and a high-frequency energy tapping. These parts are described in detail. The results of tests of the three generators are compiled in the following tables:

Type of generator	40.6-cm generator		1.64 m	2.5 m
Anode d-c voltage	8.5 kv	10.0 kv	12.0 kv	12.0 kv
d-c component of the anode-shield current	6.5 a	7.0 a	9.6 a	11.2 a
d-c component of the control-grid current	1.4 a	1.2 a	2.6 a	0.44 a
Input power	55.4 kw	70.0 kw	115.0 kw	134.0 kw
Power loss in the anode block	17.2 kw	25.1 kw	46.0 kw	53.3 kw
Power loss in the screening grid	2.7 kw	5.0 kw	8.8 kw	12.9 kw

TITLE: Experience in rolling powders in an industrial-type rolling mill

SOURCE: Moscow, Tsentral'nyy nauchno-issledovatel'skiy institut chernoy metal-
lurgii, Sbornik trudov, no. 43, 1965. Poroshkovaya metallurgiya (Powder met-
lurgy), 53-59

TOPIC TAGS: rolling mill, powder metallurgy, metal powder, powder metal rolling

ABSTRACT: The authors describe an industrial two-high powder-rolling mill with
roll diameters 600 and 900 mm, based on a standard rolling mill originally built
in 1940, and equipped with special powder-feeding bunkers. The mill consists of
an open-top steel housing with variable positioning of rolls -- they can be
aligned either horizontally or at angles of 22.5°, 45°, and 60° (Figs. 1, 2).
Its main drive is powered by a DC 257.4 kw (350 HP) 40-800 RPM motor. It has been
used for the experimental rolling of strips from the powders of iron, Okh18N9
stainless steel, molybdenum, and titanium. These experiments demonstrated the

Card 1/5

L 1662-66

ACCESSION NR: AT5022888

mill's suitability for organizing the industrial production of poreless strips from the powders of different metals and alloys. Such strips, 0.8-1.0 mm thick, display physical properties that are not inferior to those of strips produced by rolling ingot metal. This strip thickness is in complete agreement with the basic equation of rolling, which implies that strip thickness is a function of roll diameter:

$$\gamma_s = \frac{\gamma_p}{\tau} \left[1 + \frac{D}{\delta} + \frac{\alpha^2}{2} \right]. \quad (1)$$

where γ_p and γ_s are the densities of powder (bulk weight) and strip, respectively, g/cm³, D is the roll diameter, δ is the thickness of rolled strip, mm; α is the angle of reach, deg; and τ is the coefficient of reduction of the powder during rolling. Hence this basic equation applies not only for laboratory rolling mills but also for industrial rolling mills and can be used in designing the latter. Before the rolling of metal powders can be industrially introduced, however, these three problems must be solved: lateral restriction of the zone of deformation of powder in the rolls; continuous, uniform supply of powder to the feeder; and con-
